1. IMPLEMENTATION DESCRIPTION

1.1. The MIPS Processor Specs

- Single cycle MIPS processor alongside an assembler.
- 256 Bytes instruction memory (byte addressable).
- 2 Kbytes data memory (byte addressable).
- 32-bits 32 registers Register File.
- A clock with a clock period 80 ns.

1.2. Supported Instructions

- Arithmetic: **add, addi, sub**
- Load/Store: **lw, sw**
- Logic: **sll, and, andi, nor**
- Control flow: **beq, jal, jr**
- Comparison: **slt**

1.3. Languages Used For Implementation

- Verilog HDL for implementing the MIPS processor.
- Ruby for implementing the assembler. (bonus)
- Assembly and machine code for testing.

1.4. Tools Used For Implementation And Simulation

- ModelSim.
- Active HDL.
- Sublime text.

1.5. Additional Tools

- [OCRA](#) gem for packaging assembler to exe.
 - Git and Github.
-

2. DATAPATH

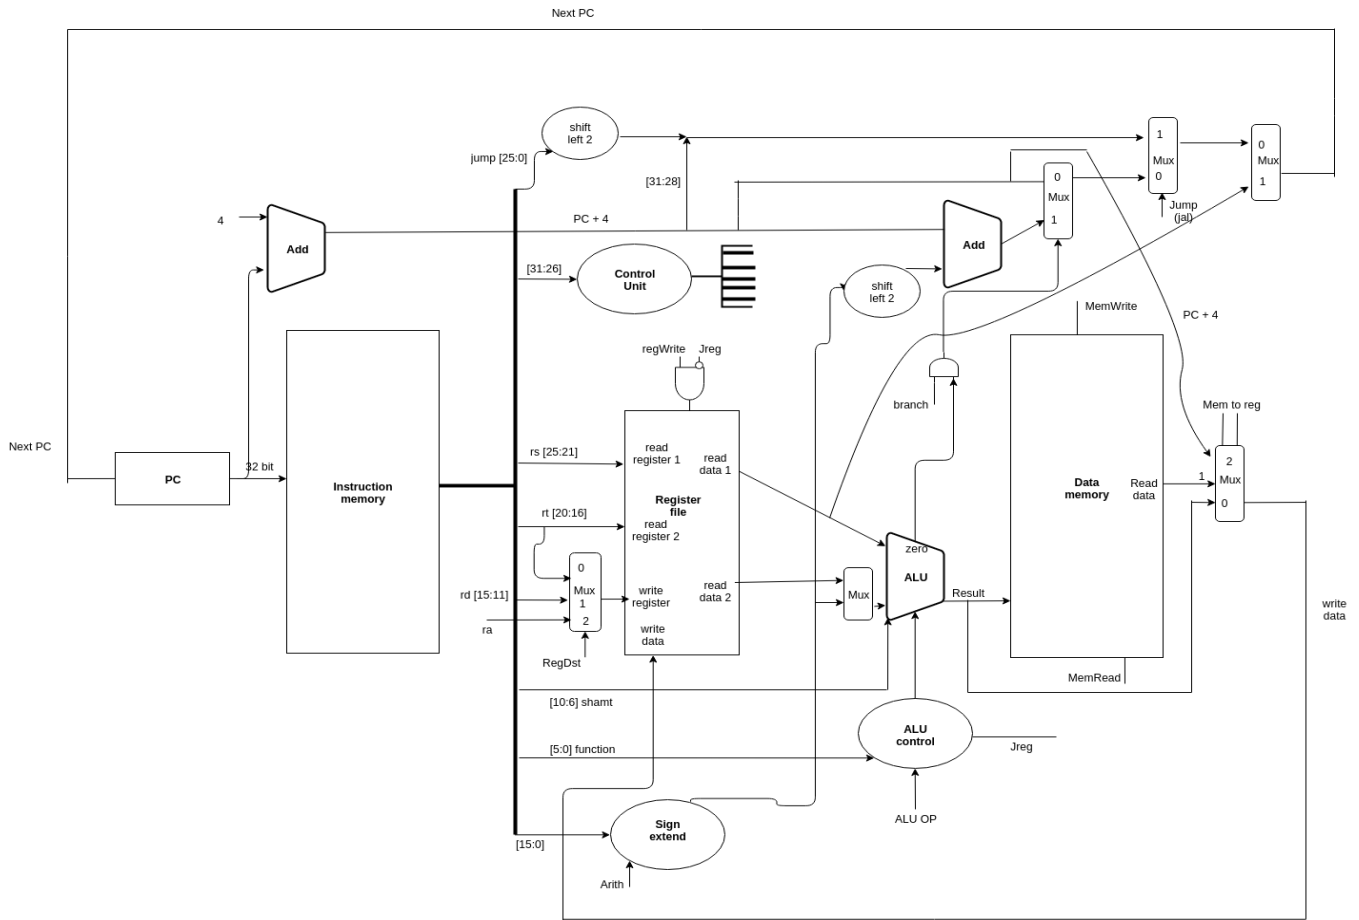

Figure 1 MIPS Processor Datapath

3. TEST PROGRAMS AND THEIR OUTPUTS

3.1. A program testing addition and subtraction

Description: This program adds and subtracts certain values and stores these values in the memory.

3.1.1. Assembly Code

```
#initializing data

addi $s0, $zero, 4      #$s0 = 4
addi $s1, $s0, 6        #$s1 = 10
addi $s2, $zero, 16     #$s2 = 16
addi $s3, $zero, 68     #$s3 = 68
addi $s4, $zero, 40     #$s4 = 40

#adding and subtracting
add $s0, $s3, $s4       #$s0 = (40+68) = 108
add $s4, $s1, $s3       #$s4 = (68+10) = 78
addi $s1, $s2, -10      #$s1 = (16-10) = 6
slt $s3, $s4, $s1       #$s3 = 0
slt $s2, $s3, $s0       #$s2 = 1

#storing data into memory

sw $s0, 4($s3)           #$s0 in loc 4 in memory (0+4) .. loc 4 contains 108
sw $s1, 8($s3)           #$s1 in loc 8 in memory (0+8) .. loc 8 contains 6
sw $s3, 4($s0)           #$s3 in loc 112 in memory (108+4) .. loc 112 contains 0
lw $s5, 8($s3)           #$s5 = 6
addi $s5, $s5, 2         #$s5 = 8
sw $s2, 12($s5)          #$s2 in loc 20 in memory (12+8) .. loc 20 contains 1
sw $s4, 20($s5)          #$s4 in loc 28 in memory (20+8) .. loc 28 contains 78
```

*we expect that location 4 in memory contains 108 in decimal or 6C in hexadecimal, location 8 contains 6, location 20 contains 1, location 28 contains 78, and location 112 contains 0.

3.1.2. Machine Code in binary

Figure 2 Program 1 Data Memory

*The memory is byte addressable, so location 4 contains 0x6C (128 in decimal), location 8 contains 0x06, location 20 contains 0x01, location 28 contains 0x4E (78 in decimal), and location 112 contains 0x00. those values are similar to the values expected before.

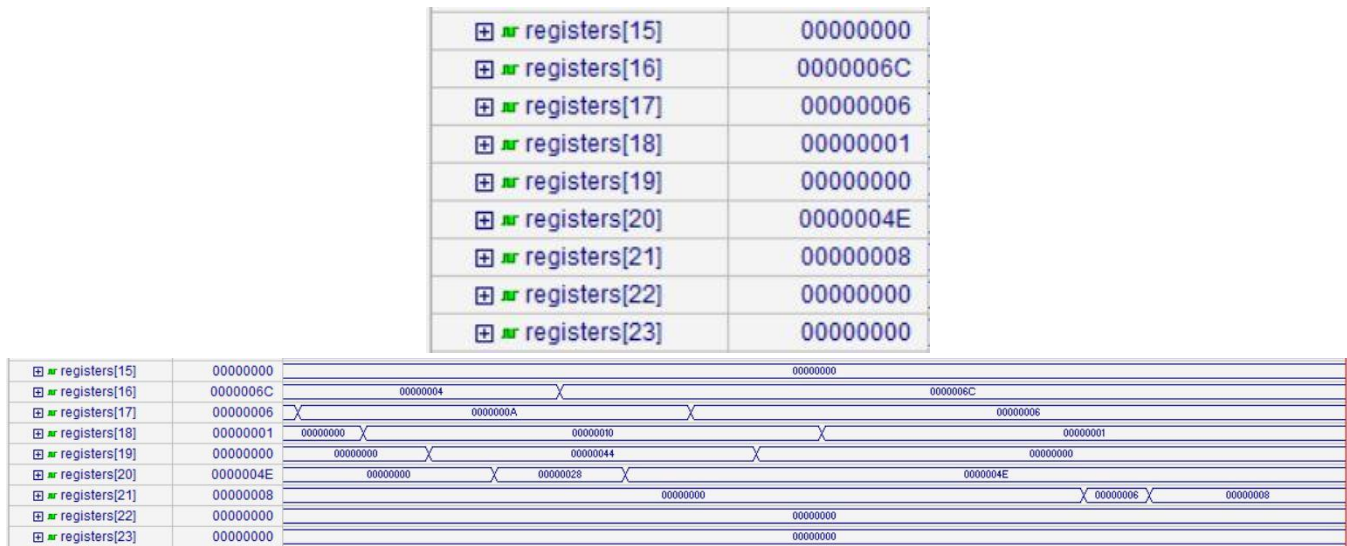

Figure 3 Program 1 Register File

3.2. A program testing If condition

Description: This program tests if condition and branch.

3.2.1. C++ Code

```
i=0;
j=14;
if (i<j) {
    A[i] = 1000;
}
i=20;
if (i<j) {
    A[i] = 2000;
}
```

3.2.2. Assembly Code

```
#initializing data
addi $s0, $zero, 4      #$s0 = 4
addi $s1, $zero, 0      #$s1 = 0
addi $s2, $s0, 10       #$s2 = 14
sw $s1, 0($s0)          #$s1 stored in location 4 .. 0 in loc 4
sw $s2, 4($s0)          #$s2 stored in location 8 .. 14 in loc 8

#if condition

lw $t0, 0($s0)          #$t0 = 0
lw $t1, 4($s0)          #$t1 = 14
slt $t2, $t0, $t1       #$t2 = 1
beq $t2, $zero, exit    #wont branch
sll $t0, $t0, 2          #$t0*4 = 0
add $t0, $t0, $s0       #$t0 = 4
```

addi \$s5, \$zero, 1000	#\$s5 = 1000
sw \$s5, 0(\$t0)	#put 1000 in loc 4
addi \$t0, \$t0, 20	#\$t0 = 24
slt \$t2, \$t0, \$t1	#\$t2 = 0
beq \$t2, \$zero, exit	#Branch
sll \$t0, \$t0, 2	#\$t0*4 = 96 .. wont be executed
add \$t0, \$t0, \$s0	#\$t0 = 100 .. wont be executed
sw \$s5, 0(\$t0)	#put 1000 in loc 100 .. wont be executed
exit:	

*we expect location 4 in memory to have 1000 in decimal (0x3E8), location 8 to have 14 (0xE), and location 100 to have 0.

3.2.3. Machine Code in binary

Figure 5 Program 2 Register File

3.3. A program testing Multiplication using SLL

Description: This program loops 10 times and multiplies A by 2 each loop, initially A equals 2.

3.3.1. C++ Code

```
A = 2;
for (i=0 ; i<10 ; i++) {
    A = A*2;
}
```

3.3.2. Assembly Code

```
#initializing data

addi $s0, $zero, 2    # $s0 = 2 -> A
addi $s1, $zero, 0    # $s1 = 0 -> i
addi $s2, $zero, 10   # $s2 = 10
addi $s3, $zero, 0    # $s3 = 0

# Multiply and Divide

loop: sll $s0, $s0, 1    # $s0 = $s0*2
      addi $s1, $s1, 1
      beq $s1, $s2, end
      jal loop
end:  sw $s0, 0($s3)      # A is stored in location 0 .. loc 0 contains 2048 (0x800)
```

*Initially A was equal to 2, the loop loops 10 times and each time it multiplies A by 2, hence, the final expected result is $2 \times (2^{10}) = 2048$ (0x800) which is stored in location 0 in memory.

3.3.3. Machine code in binary

```

Figure 8 Program 4 Data Memory

*the data memory contains values 0x800 in location 0 in memory is 0x000000D7, in location 4 is 0x00000095, in location 8 is 0x00000000, in location 16 is 0xFFFFF00, in location 20 is 0xFFFFF20, in location 24 is 0xFFFFF28, and in location 28 is 0x00000005, as expected before(memory is byte addressable).

Figure 9 Program 4 Register File

3.5. A program testing nested loops

Description: This program has two loops, each loops from 0 till 5, the program counts number of equal elements in both loops.

3.5.1. C++ Code

```
int n=0;
for (int i=0;i<5;i++)
{
    for(int j=0;j<5;j++)
    {
        if(i==j)
        {
            n++;
        }
    }
}
```

3.5.2. Assembly Code

```
#initializing data
```

```

addi $s0, $zero, 0 #n=0
addi $s1, $zero, 0 #i=0
addi $s2, $zero, 0 #j=0
addi $s3, $zero, 5
addi $s4, $zero, 0

L1: addi $s2, $zero, 0 #j=0
L2:  beq $s1, $s2, equal
    jal skip

equal: addi $s0, $s0, 1

skip:  addi $s2, $s2, 1
    beq $s2, $s3, L3
    jal L2

L3:    addi $s1, $s1, 1
    beq $s1, $s3, exit
    jal L1
exit:  sw $s0, 0($s4) #loc 0 contains 5

```

*We expect location 0 in memory to have value 5 (0x05), which is the number of times I was equal to j.

3.6. A program testing jr instruction

Description: This program loops, and uses jr instruction in jumping.

3.6.1. C++ Code

```
for(int i=0;i<5;i++)
{
    j++;
}
```

3.6.2. Assembly Code

```
addi $s0, $zero, 0    #j=0
addi $s1, $zero, 0    #i=0
addi $s2, $zero, 5
addi $s3, $zero, 16
addi $s4, $zero, 0

addi $s0, $s0, 1      #j++
```

```

    addi $s1, $s1, 1    #i++
    beq $s1, $s2, exit
    jr $s3              #jump to instruction number 4
exit: sw $s0,0($s4)

```

*The data memory is expected to contain 0x05 (as the loop loops 5 times so j = 5) in location 0.

3.6.3. Machine code in binary

Figure 15 Program 7 Register File

3.8. A program testing looping and summation

Description: this program initializes an array with ones then adds the elements of the array to each other.

3.8.1. C++ Code

```
i=0;
sum = 0;
for(int i=0;i<10;i++)
{
    sum += A[i];
}
```

3.8.2. Assembly Code

```
#initializing array

addi $s0, $zero, 12  #base address of A =12
addi $s5, $zero, 1   #A[0] = 1
addi $s3, $zero, 1   #i=1
addi $s4, $zero, 10

sw $s5, 0($s0)       #A[0] = 1 in loc 12

loop: lw $t0, 0($s0)   #$t0 = A[0] = 1
sll $t1, $s3, 2       #$t1 = i*4
add $t1, $t1, $s0     #$t1 = i*4 + base of A
sw $t0, 0($t1)        #store 1 in loc $t1
addi $s3, $s3, 1      #i++
beq $s3, $s4, endini  #if(i==10) {goto endini;}
jal loop              #jump to loop

#summation

endini: addi $s0, $zero, 0  #i=0
addi $s1, $zero, 0        #sum=0
addi $s2, $zero, 12       #base address of A =12
addi $s3, $zero, 9

label: sll $t0, $s0, 2     #$t0 = i*4
add $t0, $t0, $s2         #$t0 = i*4 + base
lw $t0, 0($t0)
add $s1, $s1, $t0         #sum = sum + A[i]
addi $s0, $s0, 1          #i++
slt $t0, $s3, $s0
beq $t0, $zero, label
```

*We expect to find 1 in location 12, 1 in each location after that from location 16 till 48 (10 elements of the array each of value 1), the sum is not stored in memory so we expect to find it in register \$s1, where register \$s1 is expected to hold 10 in decimal (0xA).

3.8.3. Machine code in binary

```
00100000 00010000 00000000 00001100

Figure 17 Program 8 Register File

*The register file is as expected before, we can see that register \$s1 (register number 17) contains 0xA which is 10 in decimal (summation of the 10 elements of the array).

3.9. A program testing checking values and branching

Description: this program checks a value using if condition and sets another value based on this check.

3.9.1. C++ Code

```
A=5;
B=5;

if(A<=B)
{
    A=10;
}
```

3.9.2. Assembly Code

```
addi $s1, $zero, 5    #A=5
addi $s2, $zero, 5    #B=5
addi $s3, $zero, 0

slt $s0, $s2, $s1      #if(A<=B) #{s0 = 0;}
beq $s0, $zero, label
jal exit
label: addi $s1, $zero, 10 #A=10
sw $s1, 0($s3)          #loc 0 contains 10
exit:
```

*Location 0 is expected to have 10 (0x0A).

3.9.3. Machine code in binary

Figure 21 Program 10 Register File

register[16] is keeping the sum int(210) as expected and values in memory.

3.11. A program testing reading initial values from memory & simple operations

3.11.1. Assembly Code

```
#Test Program #11 - LW & operations
.data
.word 15, 16

.text
addi $t0, $zero, 0
addi $t1, $zero, 4
lw $s0, 0($t0)
lw $s1, 0($t1)
add $s3, $s0, $s1
nor $t3, $s0, $s1
sll $s4, $s0, 2
```

Program is expected to load 2 values from memory and in registers keep their sum, nor, and the first shifted left by 2 -multiplied by 4-.

3.11.2. Initial data memory in binary

```
00000000 00000000 00000000 00001111
00000000 00000000 00000000 00010000
```

3.11.3. Machine code in binary

```
00100000 00001000 00000000 00000000
00100000 00001001 00000000 00000100
10001101 00010000 00000000 00000000
10001101 00110001 00000000 00000000
00000010 00010001 10011000 00100000
00000010 00010001 01011000 00100111
00000000 00010000 10100000 10000000
```

3.11.4. Clock cycles taken

7 clock cycles.

3.11.5. Simulation

⊕  mem[0]	00
⊕  mem[1]	00
⊕  mem[2]	00
⊕  mem[3]	0F
⊕  mem[4]	00
⊕  mem[5]	00
⊕  mem[6]	00
⊕  mem[7]	10

Figure 22 Program 11 Data Memory

⊕  registers[8]	00000000
⊕  registers[9]	00000004
⊕  registers[10]	00000000
⊕  registers[11]	FFFFFFE0
⊕  registers[12]	00000000
⊕  registers[13]	00000000
⊕  registers[14]	00000000
⊕  registers[15]	00000000
⊕  registers[16]	0000000F
⊕  registers[17]	00000010
⊕  registers[18]	00000000
⊕  registers[19]	0000001F
⊕  registers[20]	0000003C
⊕  registers[21]	00000000

Figure 23 Program 11 Register File

Results as expected.

3.12. A program testing load and compare

3.12.1. Assembly Code

```
#Test Program #12 - LW & compare
#pseudo code: Is b < a
.data
.word 5, 15
.text
addi $t0, $zero, 0
addi $t1, $zero, 4
```

```
lw $s0, 0($t0)
lw $s1, 0($t1)
slt $s2, $s1, $s0
```

Program is expected to load 2 values and compare them setting register \$s2 by 0 if second is greater than first value, and by 1 if second is less than first.

3.12.2. Initial data memory in binary

```
00000000 00000000 00000000 00000101
00000000 00000000 00000000 00001111
```

3.12.3. Machine code in binary

```
00100000 00001000 00000000 00000000
00100000 00001001 00000000 00000100
10001101 00010000 00000000 00000000
10001101 00110001 00000000 00000000
00000010 00110000 10010000 00101010
```

3.12.4. Clock cycles taken

5 clock cycles.

Figure 25 Program 12 Register File

Registers values as expected after running the program.

4. CONTRIBUTION

Eslam Samir Ali Abo El-Ala [ID: 1200259]

- ALU Module.
- Adder, Subtractor, SltCircuit, And, Nor, and Shiftleft Modules.
- Mux and sign extender Modules.
- ALU Control Unit Module.

Mohamed Ahmed Anwer Abdelhalim [ID: 1101803]

- Instruction Memory Module
- Data Memory Module
- Assembler [Bonus]

Nourhan Essam Ahmed Shiba El-Hamd [ID: 1201605]

- Control unit Module
- Program counter Module
- 9 Test programs [Bonus]

Shaza Ismail Kaoud [ID: 1200717]

- Register file Module
- Clock Module
- Delays formatting
- 3 Test programs [Bonus]

MIPS module, report & design was collaborative effort in team meetings.

5. ASSEMBLER MANUAL

the assembler is a simple command line tool written in Ruby and packaged to exe using “OCRA” gem.

5.1. Usage

“assembler.exe ASSEMBLY_FILE” **OR** “ruby assembler.rb ASSEMBLY_FILE”
This will generate binary code file(s) in the same folder of the ASSEMBLY_FILE

You can view the usage from the command line by calling:
“assembler.exe” **OR** “ruby assembler.rb”

Disclaimer: The exe package was packed for 64 bit Windows but not for 32 bit Windows, So if you encountered any errors during execution please download and install the latest stable ruby version from this [link](#) and run “ruby assembler.rb ASSEMBLY_FILE” from inside the “src/” folder

5.2. Supported Instructions

- Arithmetic: **add, addi, sub**
- Load/Store: **lw, sw**
- Logic: **sll, and, andi, nor**
- Control flow: **beq, jal, jr**
- Comparison: **slt**

5.3. Supported Data Types

.word

5.4. Example of Assembly File Format

```
.text
# this is an ignored comment
and $s0, $s1, $s2
label: addi $s1, $s2, -2
# another ignored comment
jal label
jr $ra # another allowed comment
sll $t0, $t1, 4
exit:
.data
.word 12, 14
.word -15
```

NOTE: labels are not supported in data segment, it will raise a syntax error
